# Chapter 1

# Analysis

## 1.1 Introduction

#### 1.1.1 Client Identification

My client is Josh Campbell, he is 24 years old. He uses computers regularly for deisgn work, so has experience of computer systems. He uses his computer to design flyers, handouts, banners and visual graphics for projection, as well as surfing the web, email and various social media networks. He rarely uses hard copies other than to preview hes work before sending it off to print. Josh uses a 2012 Mac Pro with the latest version of Apple's operating system, OS X (10.9).

Josh is the head of the media department for Cambridge Community Church. This involves being responsible for the large amount of Audio and Visual equipment used on the churches Sunday services. This currently involves spreadsheet with limited info on each item.

Josh would like to have a database management system to be able to hold information about each item and their various attributes. He would likke this database to be lovated on the churches central server so that it can be accessed by all staff if it it deemed necessary. He would use this database to store location, value and insurance details incase of damage or theft.he would like all of the information kept as a virtual copy as well as a hard copy to kept as a visual backup in case of harddrive failure or corruption.

He would also like to keep the location of each item as up to date as possible and if the location changes, he would like to be notified by email when it is entered/updated in the system.

### 1.1.2 Define the current system

The current system consists of multiple excel spreed sheets. There is one spread sheet for each of three locations; main office, main church building, and storage. Each spreedsheet consists of items located there as well as information on the value of each item, the quantity and the total value for the items with multiple entries. Each spreedsheet is divided up into equipment type (i.e Cableing, lighting, audio, visual/camera's)

### 1.1.3 Describe the problems

There are a number of problems with the current system. One of the problems is that there is no notification system to tell you when information is getting outdated or something is changed. For example, if an item is bought or sold, the total costings for that item will be updated and no-one will be notified. Another problem is that the current system doesn't show the PAT testings for all the items, these tests go out of date every 6 months and there is no way of being notified when a new PAT test is needed on an item.

## 1.1.4 Section appendix

Below are the questions that I asked my client at the interview and the answers he gave to me. I have typed up the questions and answers in markdown format then imported it as a pdf document so that it is easier to read.

Figure 1.1: Interview Questions (pg 1)

## **Interview Questions**

- 1. What does the current system do?
  - o Multiple excel spreadsheets that list all the AV equipment
- 2. What are the problems or drawbacks of the current system?
  - There is no notification system
  - o Data is easily out of date.
- 3. How much data is currently recorded?
  - Current data stored is the item name, its location, the quantity and it's value
- 4. What extra data will need to be included?
  - o PAT testing's
  - Current location
  - The item's usable state (working, in need of repair, being repaired etc)
- 5. How frequently will the data need to be updated?
  - $\circ$  The data will need to be updated a few times a month or so
  - · Whenever the location changes.
- 6. Will new records need to be added or deleted? If so, how often?
  - New records will need to be entered, or some deleted every couple of months.
  - o Whenever new equipment is bought or if an item is sold
- 7. How important is the data or information that is to be recorded?
  - Data is of high importance as it will be kept as a record for insurance in case of theft or damage
- 8. Are there any algorithms that are going to need to be implemented?
  - The number of a single item there is at a particular location
  - $\circ~$  The total number of that item altogether  $\,$
  - The sum of the values those individual items (value per unit \* quantity)
- 9. When are the algorithms going to be run?
  - These will need to be run when there are new items added/removed to a group of the same item
  - o If the value of an item changes

#### Figure 1.2: Interview Questions (pg 2)

- 10. What inputs are required for the proposed system?
  - o Inputs are likely to be text, numbers and currency
- 11. What outputs are required for the proposed system?
  - o Outputs are likely to be the same as the inputs
  - Notifications of when PAT tests are in need or reissue
  - $\circ\;$  Notifications when an items location or quantity is changed
  - · A print function would be necessary
- 12. Are hard copies required?
  - Yes, hard copies would be required a visual backup.
- 13. Are back dated records required?
  - Yes, for insurance purposes
- 14. How long are these records going to be kept?
  - · We will keep back dated records for a year
- 15. How are these records going to be stored?
  - We will store them electronically on the file server
- 16. How often will outputs be required?
  - o Outputs will be required whenever possible
- 17. What computing resources do you currently possess to aid the new system's operation?
  - We currently have a Mac Pro that we use as a file server. This is where the database system will be placed.
- 18. Is security an issue?
  - No, security is not an issue, although the data would need to be backed up.
- 19. Should there be restricted access to certain areas?
  - o No, restricted access is not needed.
- 20. What errors and exceptions will need to be reported in the new system?
  - o I'm not 100% until we start testing the system.
- 21. How should these errors and exceptions be reported?
  - Errors should be reported to you either via email or another notification

Figure 1.3: Interview Questions (pg 3)

method.

Joel Butcher

- 22. Are there any constraints on hardware, software, data, cost or time?
  - o No budget, time deadline is flexible and we'll adapt to whatever software/hardware resource available.

## 1.1.5 The current system

#### Data sources and destinations

In the current system, there are multiple data sources. The client and his colleagues as well as members of the AV crew for the church can enter data into the spreadsheet by using a computer in the office and accessing the on the server.

#### Algorithms

In the current system, there are only a few algorithms in place.

## Algorithm 1 Algorithm 1, When new item is bought:

- 1: IF Item = NewItem THEN
- 2:  $Action \leftarrow EnterNewItem$
- 3: ELSE IF Item = ItemMatch THEN
- 4:  $Action \leftarrow UpdateItem$
- **5: ENDIF**

### Algorithm 2 Algorithm 2, When an item is sold or replaced:

- 1: IF Item = Sold THEN
- 2:  $Action \leftarrow UpdateQuantity$
- 3: ELSE IF Item = Damaged THEN
- 4:  $Action \leftarrow UpdateQuantity$
- 5:  $Action \leftarrow FileInsuranceClaim$
- 6: ELSE IF Item = Stolen THEN
- 7:  $Action \leftarrow FileInsuranceClaim$
- 8: **ENDIF**

### Data flow diagrams

Figure 1.4: Flow Diagram Key.

Figure 1.5: Entering a new item.

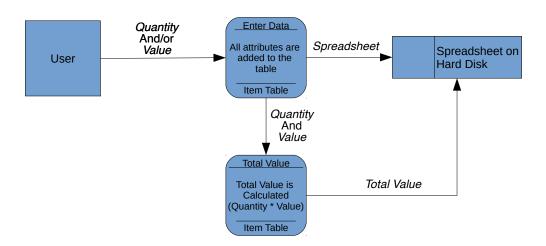

Figure 1.6: Updating an item that already exists in the table.

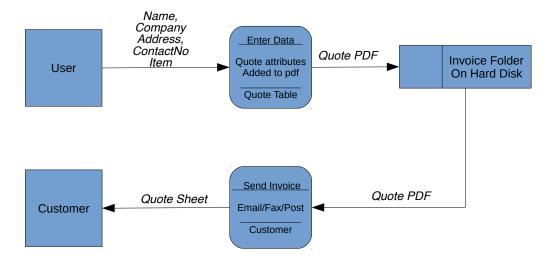

Figure 1.7: Creating and sending the initial quote for a loan.

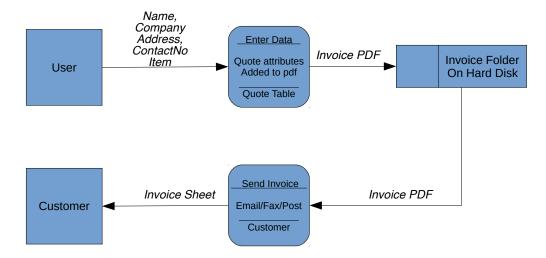

Figure 1.8: Creating and sending the final invoice for a loan.

### Input Forms, Output Forms, Report Formats

Joel Butcher

Josh has provided me with a screenshot of him entering some data into his current system. I have boxed out confidential information such as item values and their respective sub-total values:

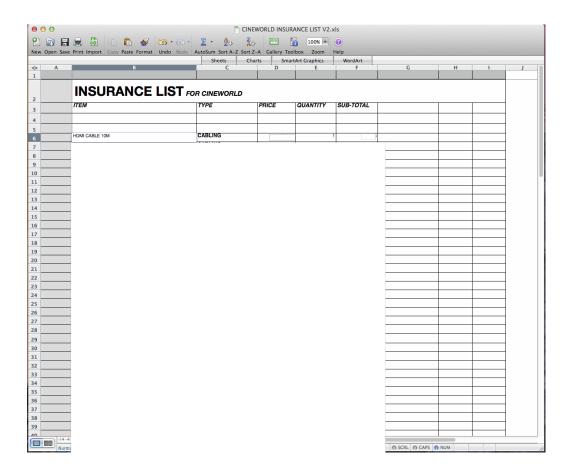

Figure 1.9: Josh Entering Item Name.

Here is an screen shot showing the calculation used to get the Sub-Total Value:

Figure 1.10: Sub-Total Calculation.

#### The proposed system 1.1.6

#### Data sources and destinations

The Following table shows the proposed data and their respective sources and destinations.

## Data dictionary

## Data dictionary

Name	Data	Length	Validation	Example	Comment
	Type			Data	
ItemTypeID	Integer	1-435	Range	253	This is the <b>Primary Key</b>
					for the ItemType class, and
					foreign key for the Item
					class
ItemType	Text	5-40 Characters	Length	Arkaos	This holds the description of
				Server	each type of Item.
LocationID	Integer	1-3 Figures	Range	1,300	This is the <b>Primary Key</b>
					for the Location class and
					a Foreign Key for the Item
					class
Location	Text	1-30 Characters	Length	Main	This holds the name of the
				Offices	locations

Name	Data Type	Length	Validation	Example Data	Comment
ItemID	Integer	1-435	Range	253	This is the <b>Primary Key</b> for the Item class, and foreign key for the Loan and PATtest classes
ItemName	Text	5-40 Characters	Length	Arkaos Server	This gives the name of each item entered
Value	Real	2-5 Figures	Range	1,300	This holds the data for the monetary value for each item
ItemQuantity	Integer	0-100	Range	35	This holds the data for the number of each item owned
SubTotal	Real	2-8 Figures	Range	250	This is calculated for each item by multiplying the value by the quantity
OnLoan	Boolean	True/False	Status Check	True	This holds the data of whether an item is on loan or not. Will be displayed as "Yes" or "No"

Name	Data	Length	Validation	Example	Comment
	Type			Data	
LoanListingID	Integer	1-435	Range	56	This is the <b>Primary Key</b>
					for the LoanListing class
ListingQuantity	Integer	1-35	Range	4	This holds the data for how
					many of an item has been
					loaned out
CustomerLoanID	Integer	1-435	Range	21	This is the <b>Primary Key</b>
					for the Loan class
LoanRate	Real	1-5 Figures	Range	75	Holds data for how much is
					charged per day for the loan
					of an item
LoanLength	Integer	1-3 Figures	Range	7	Holds the data for the
					length of the loan
LoanCost	Real	1-4 Integers	Range	250	Holds the data for the
					amount to charge before the
					loan

Name	Data	Length	Validation	Example Data	Comment
	Type				
CustomerID	Integer	1-255	Range	52	This is the <b>Primary</b>
					<b>Key</b> for the Customer
					class
Forename	Text	3-20 Characters	Length	John	A field for the cus-
					tomers forename
Lastname	Text	3-20 Characters	Length	Smith	A field for the cus-
					tomers surname
Company	Text	3-20 Characters	Length	Digital Lighting Cambs	A field for the com-
					pany's name
Street	Text	3-30 Characters	Length	129 Cedar Crescent	A field for the com-
					pany's Street address
Town	Text	3-30 Characters	Length	Sawston	A field for the com-
					pany's Town
County	Text	3-20 Characters	Length	Cambs	A field for the com-
					pany's County
PostCode	Text	6-7 Characters	Format	CB22 7RX	A field for the com-
					pany's Postcode
MobileNumbe	er Text	11 Characters	Format	07891234567	A field for the cus-
					tomers mobile number
LandLine	Text	11 Characters	Format	01234567890	A field for the cus-
					tomers landline phone
Email	Text	7 - 30 Characters	Length	john.smith@example.com	A field for the cus-
					tomers email address

Name	Data	Length	Validation	Example Data	Comment
	$\mathbf{Type}$				
ItemTestID	Integer	1-255	Range	52	This is the <b>Primary Key</b>
					for the ItemTest class
ItemDescription	Text	3-400	Length	Waltham portable TV	A field that describes the
		Characters			item to be tested
ItemClass	Integer	1 Charac-	Length	2	A field to show what class
		ter			of electrical equipment the
					item is
FuseRating	Text	1-3 Char-	Length	5A	A field which displays the
		acters			fuse rating
TestUsed	Text	1-10 Char-	Length	II	A field to show what test
		acters			was used on the item
ProtectiveCondTest	Float	4 Charac-	Length	-	A field displaying the resis-
		ters			tance of an item, in Ohms,
					to a 200mA current
InsulationTest	Text	3 Charac-	Length	¿20	A field displaying the Insu-
		ters			lation of an item, in Ohms,
					to a 250V or 500V Potential
					Difference
Leakage	Float	4 Charac-	Format	0.03	A field that shows the cur-
		ters			rent not obtained by the
					item, in milliamperes
TestResult	Boolean	-	Presence	True	A field to show if an item
			Check		Passed or not
	·		·		

Name	Data	Length	Validation	Example Data	Comment
	Type				
PATtestID	Integer	1-255	Range	52	This is the <b>Primary</b>
					<b>Key</b> for the PATtest
					class
TestDate	Date	10 Characters	Format	01/12/2014	A field that displays
					the date of the PAT
					test

#### Volumetrics

I have chosen to start off with only 20 Item Records along with 20 Loan Records and 20 PAT Test Records. In total there will be 60 Records. I have chosen this number of records as my Client and I had previously agreed that this would be a suitable number of records to start with in order for him to get used to the system and train up other colleagues to know how to use it also. This can be increased as time goes by.

The Item Records Database, Loan Records Database and the PAT Test Records Database will store 18 fields of combined data. Each field should take up 1KB of hard disk space. With this the required initial storage space will be:

18KB \* 60 = 1080KB

1080KB / 1024 = 1.05MB

If the rest of database management system took up 28MB, the client would need 19.05MB of space for 60 records, with 18 fields of data

## 1.2 Objectives

## 1.2.1 General Objectives

- Easily understandable layout and structure for records.
- Data is easy to enter and edit
- Viewing of records is structured and well presented

## 1.2.2 Specific Objectives

Record viewing:

- Clear labels for data attributes.
- Next and Previous record buttons.
- Edit button so data cannot be changed accidentally.
- Submit button to save data changes (if any) to the current record.

• First and Last record buttons to jump to respective record.

#### Data input:

- Data fields become editable
- Drop down selection for location selection
- Changes saved immediately after editing has finished (i.e. submit button pressed)

#### Data output:

- Print button and functionality
- Export records to PDF
- Print/Export a batch of records to PDF
- Email notifications when new item is entered into database or an item is updated, the details and who entered/updated.

## 1.2.3 Core Objectives

- Viewing of Item/Loan/PAT-test Records
- Item/Loan/PAT-test data input
- Item/Loan/PAT-test data editing
- Sending of Loan Invoices

## 1.2.4 Other Objectives

- Generating and exporting of quote sheets to PDF
- Generating and exporting of invoices to PDF
- Printing and Exporting records to PDF
- Enable Full screen application on OS X

## 1.3 ER Diagrams and Descriptions

## 1.3.1 ER Diagram

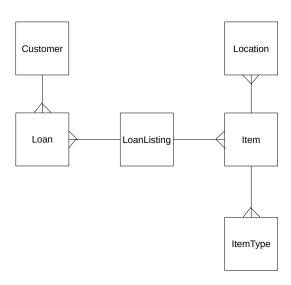

Figure 1.14: Loan Item ER Diagrams.

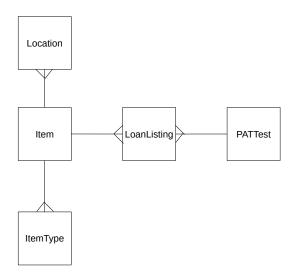

Figure 1.15: PAT Test ER Diagrams.

## 1.3.2 Entity Descriptions

ItemType(ItemTypeID, ItemType)

Location(LocationID, Location)

**Item**(<u>ItemID</u>, *ItemTypeID*, *LocationID*, Name, Location, Value, ItemQuantity, SubTotal, OnLoan,)

**LoanListing**(LoanListingID, *ItemID*, ListingQuantity)

Loan(LoanID, CustomerID, LoanRate, LoanLength, LoanCost)

Customer(<u>CustomerID</u>, Forename, Lastname, Company, Street, Town, County, PostCode, MobileNumber, LandLine, Email)

PATtest(PATtestID, TestDate)

**ItemTest**(<u>ItemTestID</u>, <u>PATTestID</u>, ItemDescription, ItemClass, FuseRating, TestUsed, ProtectiveCondTest, InsulationTest, Leakage, TestResult)

## 1.4 Object Analysis

## 1.4.1 Object Listing

- Client
- Item
- Location

## 1.4.2 Relationship diagrams

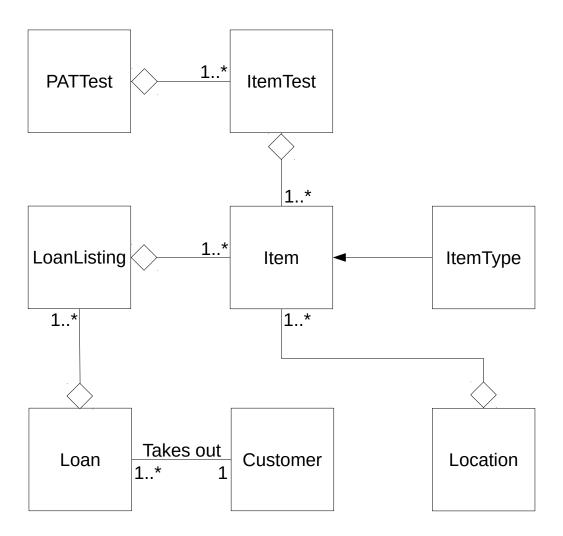

Figure 1.16: Relatioship Diagram.

## 1.4.3 Class definitions

Figure 1.17: Class Diagram Key.

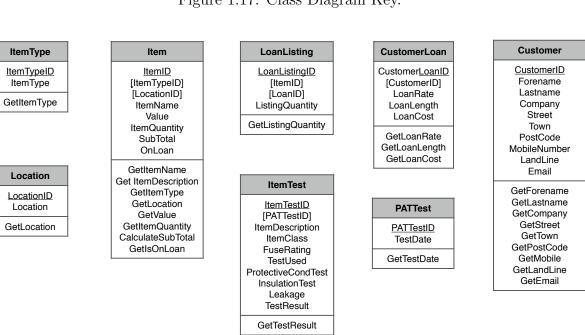

Figure 1.18: Class Diagrams.

32

## 1.5 Other Abstractions and Graphs

## 1.6 Constraints

#### 1.6.1 Hardware

Presently, Josh uses a custom built, 2008 MacPro Desktop Computer. This is primarily used as a file server for images, audio and video files a well as a backup for his current work desktop. My system will need to be compatible with this system.

#### Computer Specifications:

- 2x 2.8 GHz Quad-Core Intel®Xeon<sup>TM</sup>Processor
- ATI Radeon HD 2600 XT 256MB Graphics Card
- 661-4449 Apple Mac Pro A1186 Motherboard
- 16.00GB DDR3 RAM
- 1TB SATA Disk-Drive
- 6TB RAID Storage
- Apple SuperDrive
- 15" LG E1942 LCD Display. 1280 x 720 pixels

The proposed system should have little to no impact on this machine as the processing power and memory that can be dissipated by the computer, greatly exceeds the requirements for the proposed system.

One other constraint of the computer to be used is that it is a desktop computer. This means that the system is only accessible where Josh chooses to have the computer based in his place of work, as the computer is not portable. In addition to this, the computer requires a constant supply of power in order to operate as there is not internal battery.

One other constraint of the computer to be used is that it is a desktop computer. This means that the system is only accessible where Josh chooses to have the computer based in his place of work, as the computer is not

portable. In addition to this, the computer requires a constant supply of power in order to opperate as there is not internal battery.

### 1.6.2 Software

Josh has told me that he is able to adapt to the software that is required to run the system. The current operating system in place is Apples OSX 10.8 (Mountain Lion). Josh wishes to update the software sometime in the near future to OSX 10.9 (Mavericks) and possibly update to OSX 10.10 (Yosemite). This could prove to be constraint because OSX 10.10 (Yosemite) isn't yet fully supported by some applications.

### 1.6.3 Time

Josh has said that there is no deadline requirement for the proposed system to be in place and doesn't need it until I have finished implementing it. The only deadline I need to meet is the project deadline set by my Computing course leader. This is Friday 13 <sup>th</sup> February 2014.

## 1.6.4 User Knowledge

Josh posses a qualification in A level Media studies as well as 2 years use of computers during his degree. He has substantial understanding of how to use computers as his job requires he uses one most of the time. Josh also has required knowledge of how to use many varieties of applications. He uses Adobe Creative Suite for most of his job as he designs various forms of media. He also has knowledge of Apple's Final Cut Pro application as well as many others.

When designing and implementing the proposed system, Josh's experience with computers will have to be considered. Josh tends to use the internet browser Google Chrome for all his web-browsing and research as well as a third party mail application called. By designing the system similarly to these applications, it should make it easier to understand how the system works and get used to using it a lot faster than it would if the system had a

primitive design.

Joel Butcher

There will also be a full manual included to aid Josh with learning and understanding the familiar interface, the functionality of the new system and how to use certain features.

#### 1.6.5 Access restrictions

The proposed system is primarily to be accessed by Josh himself. However, he can see it being an advantage if other people had access to the system.

For this reason, we have agreed that having the database password protected is the best way for Josh to control who can access the data. He will be able to distribute the passwords to other colleagues who he feels should have access to the database management system. This reduces the risk of records being changed or deleted by people who shouldn't need to use the system.

#### 1.7 Limitations

#### Areas which will not be included in computeri-1.7.1sation

Initial buying of new items will not be included in the computerisation as this is still done either in person or over the world wide web. Similarly, initial sales of items will not be included in the computerisation, it will only be once the item has been bought/sold that the data will be updated to coincide with the quantity changes and/or addition to or deduction or equipment.

#### 1.7.2Areas considered for future computerisation

When a customer loans out equipment, Josh sends out an initial quote, either as an email format or on paper. This could be included in the system by selecting the items the customer wants to high out, and draft a quote form for Josh. Similarly, Josh sends out an emailed invoice to the client, he does this manually by hand. It would be advantageous to include this into the system, by generating an invoice based on the attributes in Loan Records and export it as a PDF for email or printing. These could be implemented in addition to the current database design at the end, if I have enough time to learn and understand how to enter this functionality it into the system

## 1.8 Solutions

### 1.8.1 Alternative solutions

Alternative	Advantages	Disadvantages		
solution				
Custom made database	• No need to install additional software, only a simple database management system such as "Microsoft Access" or "Filemaker".	• Database management systems often cost a substantial amount of money for a license.		
Web based application	<ul> <li>Easily accessible by other users. Doesn't rely on one machine.</li> <li>Can have 'Cloud based' storage of files.</li> <li>More than one user can be logged on at a time.</li> </ul>	<ul> <li>Website or server hosting can be expensive.</li> <li>More advanced security methods will be required due to the system being constantly online and therefore vulnerable to attack.</li> <li>Better networking knowledge required to compensate for the security implications and risks.</li> </ul>		

Alternative	Advantages	Disadvantages		
solution				
Terminal or Command based application	<ul> <li>More power efficient as it isn't graphics heavy, much easier to design as the interface is just text.</li> <li>Fast efficient operation provided the client has knowledge of terminal and shell commands.</li> </ul>	<ul> <li>Careful error handling needed as the user could enter any known/valid command.</li> <li>Training is required so that the client knows what commands to use when.</li> <li>There are often commands that the client don't know about that could potentially corrupt his computer.</li> </ul>		
Python desktop application with a GUI	<ul> <li>Designed and layout can be client specific.</li> <li>Minimal error with radio buttons and other widgets.</li> <li>Easy to understand layout as data can be formatted to fit the clients requirements.</li> <li>Easy to visualise what is happening with graphs and tables.</li> </ul>	<ul> <li>More time needed to build the interface and sql database compared to a command based application.</li> <li>More resources needed from the computer for graphical visualisation and database storage</li> <li>Programming the graphical interface could prove a difficult task.</li> </ul>		

### 1.8.2 Justification of chosen solution

I have chosen to use the 'Python Desktop Application with a GUI' solution.

These are my reasons:

- The application takes up no physical space apart from the computer it is installed on.
- I already have the required language knowledge needed to program a

database and a GUI in Python

- Using a custom made desktop application is faster for Josh to manage his inventory than the current spreadsheet based system.
- Backup can be made and data can be restored easily in the event of corruption or unresolvable data loss

# Chapter 2

# Design

## 2.1 Overall System Design

### 2.1.1 Short description of the main parts of the system

- Media Inventory Database
  - General Interface
  - Adding Records
  - Displaying Records
  - Searching Records
  - Editing Records
  - Deleting Records

### General Interface

- The user will be presented with a box whereby he/she will enter a password. This password will be the same for all users who have access to the system.
- Once logged in, the user will be confronted with an interface consisting of a series of menu options. These options will be "Add Record", "Display Records", "Search Records", "Edit Record", "Delete Record" and "Change Password".

- When the "Change Password" button has been clicked, the user will be taking to a box where they will be required to enter the previous password, then enter a new password twice.
- Clicking on the "Add Record" button will take the user to an interface where they will be required to select the type of record they wish to enter.
  - Clicking the "Add Loan" button will present an interface to the user where they will have a choice of selecting an existing customer specific loan or creating a new customer specific loan.
  - Selecting the "Add PAT Test" button will present the user with an interface to choose a PAT test date or to create a new PAT test date.
- Clicking on the "Display Records" button will send the user to an interface where they will have to select the table from which table they wish to see the records.
- Clicking on the "Edit Records" button will send the user to an interface where they will have to select the table from which they want to edit a record.
- Clicking on the "Delete Records" button will send the user to an interface where they will have to select the table from which they wish to delete a record.

#### Adding Information

- The system will present the user with a drop down menu from which the user will have to choose an option for which to enter information. After selecting the option, the user will then be presented with a group of data to add to the new record. If any of these options require the user to enter data relating to another table within the database, they will be presented with a drop down menu and will be required to select an option before they record can be created.
- Once all the required data fields have been complete, the system will add a unique identifier to the record of information and save in to the database

### Displaying Records

Joel Butcher

- The system will present the user with an interface with a drop down menu, where they will have to select the database table from which they wan to view the data.
- Once the table has been selected, the user will then be presented with a view table that will display all the records within that database table. They can then choose to sort this information into ascending or descending order by selecting any row for which to sort it by.

#### Editing Records

- The system will bring up a user interface that will present a drop down menu where the user will have to select a database table from which they wish to edit a record.
- Once a table has been selected, the user will then be confronted with a user interface which will display all the records within that table and then prompt the user to select the record they would like to edit, by enter the unique identifier of this record.
- When the record has been selected, the user will be presented with an interface similar to the one where the user enters a new record, but the fields already contain the information. The user will then have to update which field of information to update.
- Once data has been updated and a "Done" button has been clicked. the user will then be asked to confirm the updates.
- When the updates have been confirmed, the system replace the old record with the new updated record.

### Deleting Records

- The system will present the user with an interface containing a drop down menu where they will have to select a database table from which they wish to delete a record.
- After the database table has been selected, the user will be presented with a view table showing all the records within the database table. Underneath the view table will be a prompt, asking the user for the unique identifier of the record they wish to delete.

- When the user has selected the record they wish to delete, they will have to confirm this by entering the system password.
- The system will then remove the record from the database permanently.

Clicking the "Logout" button will return you to the login screen.

Figure 2.6: Login and Main Menu windows.

Figure 2.7: Login and Main Menu windows.

Figure 2.8: Login and Main Menu windows.

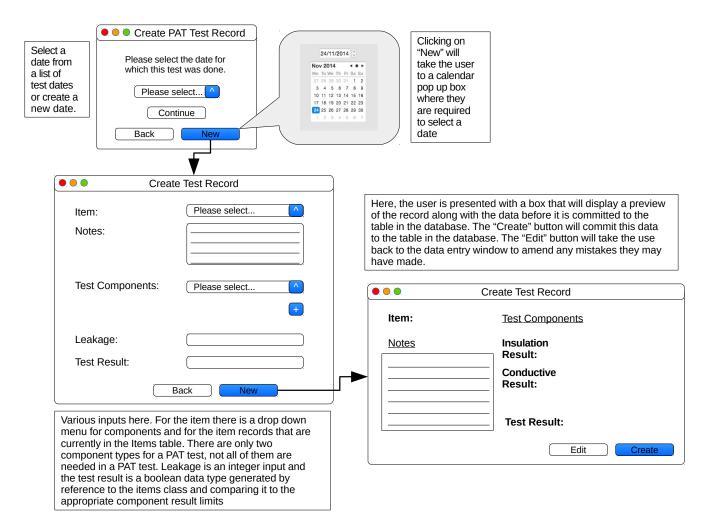

Figure 2.9: Login and Main Menu windows.

## 2.3 Hardware Specification

The hardware I am going to use are for a custom built Early 2008 Mac Pro. The specifications are as follows:

- 2x 2.8 GHz Quad-Core Intel®Xeon<sup>TM</sup>Processor
- ATI Radeon HD 2600 XT 256MB Graphics Card
- 661-4449 Apple Mac Pro A1186 Motherboard
- 16.00GB DDR3 RAM
- 1TB SATA Disk-Drive
- 6TB RAID Storage
- Apple SuperDrive

I have chosen to build my system for this specification as this is the computer my client is going to run the application on, it is also a low cost choice of system spec to run on as the hardware has already been bought and is therefore ready and available to use.

# 2.4.2 Algorithms in pseudo-code for each data transformation process

```
Algorithm 3 Producing a PDF via print function
 1: officeAddr \leftarrow ['Street', 'Town', 'County', 'PostCode']
 2: loanItems \leftarrow self.getItemsInLoan()
 3: customerDets \leftarrow self.getCustomerDetails
 4: FOR item \leftarrow loanItems TO
       loanRate \leftarrow item[2]
       amountDue \leftarrow amountDue + loanRate
 6:
 7: ENDFOR
 8: amountIncVAT \leftarrow amountDue * 1.2
 9: invoiceInfo \leftarrow [officeAddr, loanItems, customerDets, amountDue, amountIncVAT]
10: htmlInvoice \leftarrow self.createHtmlInvoice(invoiceInfo)
11: self.printer \leftarrow QPrinter()
12: printerDialog \leftarrow QPrintDialog(self.printer, self)
13: IF printerDialog.exec() THEN
       document \leftarrow QTextDocument
       document.setHtml \leftarrow html
15:
       document.Print \leftarrow self.printer
16:
17:
       message \leftarrow "The document printed successfully"
18:
       QMessageBox.information \leftarrow self, "PrintSuccessful", message
19:
20: ELSE
       message \leftarrow "The document was unable to print."
21:
       QMessageBox.information \leftarrow self, "PrintFailed", message
22:
23: ENDIF
```

NB. The reason that "document.Print" has a capitalised 'P' is because LaTeX doesn't like the underscore that should be after it

## 2.6 Definition of Data Requirements

### 2.6.1 Identification of all data input items

- Item Name
- Item Value
- Loan Rate (The amount charged, per day, for the loan of the item)
- Item Class (This is the class for electric items and determines the type of PAT test it receives)
- Fuse Rating
- Start Date (The exact date a loan started)
- Loan Length (The length of the loan in days)
- Quantity (The quantity of an item to be loan out, if there is more than one in stock)
- Forename
- Surname
- Company
- Street
- Town
- Post Code
- Mobile Number
- Email Address
- Landline Number
- Test date (The date on which the PAT tests took place)
- Test Description (Notes referring to why an item failed or other notes about an individual item)
- Leakage (The current not obtained by an electrical item)
- Test Result (The result of the PAT test either Pass or Fail)

#### Identification of all data output items 2.6.2

- Sub Total Cost (Loan Rate multiplied by the Quantity)
- Total Cost (The sum of all the Sub Total Costs in a single loan)

### Output to database

• Item Name

Joel Butcher

- Item Value
- Loan Rate (The amount charged, per day, for the loan of the item)
- Item Class (This is the class for electric items and determines the type of PAT test it receives)
- Fuse Rating

	$\mathbf{Type}$				
PATtestID	Integer	1-255	Range	52	This is the <b>Primary Key</b>
					for the PATtest table
TestDate	Date	10 Charac-	Format	01/12/2014	A field that displays the
		ters			date of the PAT test
ItemTestID	Integer	1-255	Range	52	This is the <b>Primary Key</b>
					for the ItemTest table
ItemDescription	Text	3-400	Length	Waltham portable TV	A field that describes the
		Characters			item to be tested
ProtectiveCondTest	Float	4 Charac-	Length	-	A field displaying the resis-
		ters			tance of an item, in Ohms,
					to a 200mA current
InsulationTest	Text	3 Charac-	Length	¿20	A field displaying the Insu-
		ters			lation of an item, in Ohms,
					to a 250V or 500V Potential
					Difference
Leakage	Float	4 Charac-	Format	0.03	A field that shows the cur-
		ters			rent not obtained by the
					item, in milliamperes
TestResult	Boolean	-	Presence	True	A field to show if an item
			Check		Passed or not

### 2.6.5 Identification of appropriate storage media

My system will not need to be accessed by more than 5 people, storing the database file on the server won't be necessary as everyone will then have access to the database file. Therefore, I have chosen to store the database file and application on a single machine which can be accessed by the people who need to use it at any time. The computer is in a central location and easily accessible by those who need to use it and has multiple hard disk drives which I can make use of for storage and backup. I will be using hard disk drives (HDD's) as my client already ownes them and they are cheaper than solid-state drives (SSD's).

### 2.8 SQL Queries

### 2.8.1 Get Items from Item Table

SQL query getting all the items from the Item table in the database ready to be formatted and displayed on screen

```
Item.ItemID,
Item.ItemName,
Item.ItemValue,
Item.LoanRate,
Item.ItemClass,
Item.FuseRating,
ItemType.ItemType,
Location.Location
FROM Item, ItemType, Location
WHERE Item.LocationID = Location.LocationID
AND Item.ItemTypeId = ItemType.ItemTypeID
```

### 2.8.2 Get Items from Item Table

SQL query getting all the loans from the Loan table in the database ready to be formatted and displayed on screen

```
SELECT
Loan.LoanID,
Loan.StartDate,
Loan.LoanLength,
Customer.CustomerID,
Customer.Company,
FROM Loan, Customer
WHERE Loan.CustomerID = Customer.CustomerID
```

#### Get all Loan Items from LoanItem Table 2.8.3

Joel Butcher

SQL query getting all the loan items from the LoanItem table in the database ready to be formatted and displayed on screen

```
SELECT
      LoanItem.LoanItemID,
2
      LoanItem.LoanID,
      LoanItem. Quantity,
      Item. ItemName,
      Item.LoanRate,
      FROM LoanItem, Item
      WHERE LoanItem.ItemID = Item.ItemID
```

#### Get all Item Tests from ItemTest Table 2.8.4

SQL query getting all the item tests from the ItemTest table in the database ready to be formatted and displayed on screen

```
SELECT
ItemTestID ,
ItemTest.PATtestNotes,
ItemTest.Leakage,
ItemTest.TestResult,
Item.ItemName,
Item. ItemClass,
Item.FuseRating
FROM ItemTest
WHERE ItemTest.ItemID = Item.ItemID
```

#### Search Item Table for Items 2.8.5

SQL Query searching the database for Items at a specific Location then orders them A-Z by ItemName Location and Item are tables in the database, Item ID, ItemName and ItemValue are attributes in the Item table. LocationID is an attribute in the Location table

```
SELECT
Item. ItemID,
```

```
Item.ItemName,
Item.ItemValue,
Location.LocationID
FROM Item, Location
WHERE LocationID = ? AND
Location.LocationID = Item.LocationID
ORDER BY ItemName ASC
```

### 2.8.6 Search Customer Table for Customers

SQL Query searching the database for certain ItemTypes then orders them by ItemName from A-Z Location and Item are tables in the database, Item ID, ItemName and ItemValue are attributes in the Item table. ItemTypeID is an attribute in the ItemType table

```
SELECT
Item.ItemID,
Item.ItemName,
Item.ItemValue,
ItemType.ItemTypeID
FROM Item, Location
WHERE ItemTypeID = ? AND
ItemType.ItemTypeID = Item. ItemTypeID
ORDER BY ItemName ASC
```

### 2.8.7 Search for loans taken out by a given Company

SQL Query searching the database to display Loans taken out by a certain Company, ordered by date ascending

```
SELECT
Loan.LoanID
Customer.Company,
Item.ItemName
Item.LoanRate
LoanItem.Quantity,
Loan.StartDate,
Loan.LoanLength,
FROM Loan, Customer, Item
```

WHERE Customer.CustomerID = Loan.CustomerID AND
Loan.LoanItemID = LoanItem.LoanItemID AND
LoanItem.ItemID = Item.ItemID

# 2.9 Security and Integrity of the System and Data

### 2.9.1 Security and Integrity of Data

The system will store personal data referring to an individual or a company. This data will fall under the data protection acts. This will mean that the data will need to be kept up to date and would therefore need a way to edit the data. All the information stored in the database should therefore be encrypted to keep this data secure and only accessible through my program which will be protected with a password. I will need to make sure the data stored is valid and correct, to do this I will need to use validation algorithms to make sure they are feasible.

I will also referential integrity in my database to make sure that when updating records such as Items, that the Location and ItemType records will not be affected by the changing of either LocationID or ItemTypeID in the Item table. This will take place in all the tables in the database that require foreign keys. I will use the "ON UPDATE CASCADE" SQL clause when updating the primary key of a record, records from other tables that use that primary key as a foreign key will also be updated.

Furthermore, I will use the "ON DELETE SET NULL" SQL clause as it will set the foreign key of any record to NULL if the record with that primary key has been deleted. This will be especially useful for the Location table as there will be temporary locations and the records that reference to a temporary location will not be deleted if the location is. This enables the user to back into the database and update the location.

### 2.9.2 System Security

It is important that the information in my database is secure and free from theft, corruption and tampering. This will be prevented with the use of a password to access the system. If the password that was entered is incorrect, the user will not be able to gain access to the system and will be notified by a pop-up window. I will need to encrypt my data to avoid people from outside my system from being able to access the data. All of the data entered into the system will undergo validation to make sure that it is suitable and correct. Because some of the data fall under the data protection act, I will need to ensure that:

- The data will be destroyed after 11 years of collection
- Only data that is necessary will be collected and stored.
- The data will be updated when necessary so that the data is up to date and accurate
- The data that is stored will only be used by the Church and not passed on to anyone else
- The data will be secured securely, to ensure that it is only accessed by authorised people
- The data will not be transferred to other countries

### 2.10 Validation

In order to insure that information is not entered incorrectly, the system will need to use certain validation methods in order to achieve appropriate data is input.

Item	Example		Validation or Veri-	Comments
			fication Method	
ItemName	Asus	PC	Presence check	Ensure a name is en-
	Tower			tered. No other val-
				idation needed as an
				ItemName can be any
				length

ItemValue	400	Presence check Size Check	Ensure a number is entered at that it is greater than 0
LoanRate	7	Presence Check	Ensure a value is entered that is 0 or greater
Item Class	Multiple Choice	Lookup Check Presence Check	Only two available Item Classes
Fuse Rating	3A	Presence Check	Ensure a value is entered
Start Date	01/12/2014	Presence Check	Ensures a date is entered
Loan Length	7	Presence Check	Ensures a valid value is entered and is 0 or greater
Quantity	2	Presence Check	Check that a value is entered
Forename	John	Presence Check	Ensures a name is entered
Surname	Smith	Presence Check	Ensures a name is entered
Company	Digital Inc	Presence Check	Ensures a company is entered
Street	10 Cedar Close	Presence Check	Ensures a street is entered
Town	Great Shelford	Presence Check	Ensures a town is entered
Post Code	AB12 4XY	Presence Check Type Check	Ensures a postcode is entered and that it contains at least a number and a letter
Mobile Number	01234567890	Presence Check	Ensures a mobile number is entered and that it has a character length of 11
Email Address	example@ur	l. Eursence Check Type Check	Ensures an email is entered and that it contains the characters '@' and '.'

Landline Num-	01234567890	Presence Check	Ensures a mobile
ber			number is entered and
			that it has a character
			length of 11
Test date	01/12/2014	Presence Check	Ensures a date is en-
			tered
Test Result	yes	Presence Check	Ensures that a yes or
			no is entered. This is
			converted to a boolean
Password	p4assw0rd	Presence Check	Ensures a password is
		Type Check	entered and that it
			contains a letter and a
			number

# 2.11 Testing

# 2.11.1 Outline Plan

Test Series	Purpose of Test	Testing Strategy	Strategy Rationale
	Series		
1	Test the flow of	Top-down testing	To make sure that user inter-
	control between in-		faces interact correctly and don't
	terfaces		present graphical glitches or bugs
2	Test data input val-	Botton-up testing	Testing of each component will
	idation works		commence when they have been
			developed
3	Test data input is	Black box testing	Ensure that data input by the
	stored correctly		user is stored at the correct loca-
			tions within the database
4	Test Algorithms	White box testing	Make sure calculations such as
	and check output		loan costs are calculated correctly
	is correct		when including VAT
5.	Test system meets	Acceptance Testing	Make sure the system meets the
	requirements		all the clients expectations and
			fulfils all primary objectives
